1). Wild West produces two types of cowboy hats. A type 1 hat requires three times as much labor time as a type 2. If the all available labor time is dedicated to Type 2 alone, the company can produce a total of 450 Type 2 hats a day. The market limits for the two types are 100 and 300 hats per day for Type 1 and Type 2, respectively. The profit is $8 and $5 per Type 1, 2. Determine the number of hats of each type that would maximize profit.

i. Build the mathematical model of the problem.

ii. Solve the problem graphically.

i.)

Type 1	Type 2	t: time
3t	t	→ Total süre: (450 t)
(150)	(450)	
100	300	1500
$8 → a tane	$5 → b tane	

$450t - (3at + bt) = 0$

$8a + 5b \rightarrow max$

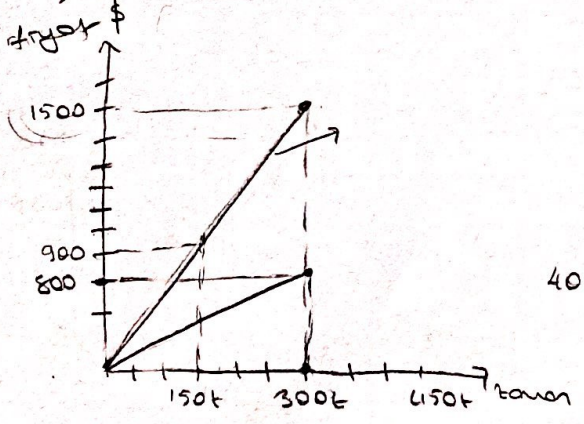
$3a + b \rightarrow$

800

(a)

at

ii.)



$50 \times 8 = (400)$

$5(t) + 8.3t$

?

$400 + 1500 = \underline{1900}$ $

300 Type 2 hats

50 Type 1 hats

max. profit 1900 $
